

ScribbleGraph

Turn handwritten notes into a smart, searchable knowledge graph —
capture, digitize, link, and learn. Built for engineering students.

scribblegraph-api.youtopialabs.workers.dev

THE PROBLEM

Your best notes are trapped on paper.

Derivations, diagrams, formulas — hours of work you can't search, can't back up, and forget in a week. Old topics never connect to new ones when you revise.

Not searchable

find that formula
from 3 weeks ago?
good luck

Not connected

revision notes never
link back to originals

Not safe

one lost notebook =
everything gone

THE APP · HOME

Everything in one place.

- 1 **Capture** — start a scan from camera or photos
- 2 **Your sessions** — each capture becomes a titled note card
- 3 **Stats** — pages, concepts and cross-links found so far

STEP 1 · CAPTURE

Just flip the pages. The camera does the rest.

No buttons while scanning, no manual cropping. The app cleans up skew and glare, keeps the pages in order, then hands them to the AI pipeline.

STEP 2 · PROCESS

Every page gets digitized in seconds.

- 1 Live progress** — each page shows its pipeline stage
- 2 OCR confidence** — handwriting quality scored per page
- 3 Auto-titled** — AI names the session from its content

Scan and text, side by side.

Fourier Series Introduction

Any periodic function $f(t)$ with period T can be written as a sum of sines and cosines.

$$f(t) = a_0/2 + \sum_{n=1}^{\infty} [a_n \cos(2\pi n t / T) + b_n \sin(2\pi n t / T)]$$

The coefficients are found by orthogonality of sinusoids:

$$a_n = (2/T) \int_0^T f(t) \cos(2\pi n t / T) dt$$
$$b_n = (2/T) \int_0^T f(t) \sin(2\pi n t / T) dt$$

Orthogonality: integral of $\sin(mt) \sin(nt)$ over a period is zero unless $m = n$.

- 1 Original scan — always kept, clickable regions
- 2 Extracted text — editable if OCR misreads a word
- 3 Related notes — cards linking to other days (next slide)

THE MAGIC ✨

It remembers what you wrote 2 weeks ago.

Each page is compared, by meaning, against every page you've ever captured. When today's notes cover the same idea as an old one, they get linked — automatically.

45 connections were found across 18 pages from 7 different days —
imagine a full semester.

STEP 4 · EXPLORE

Your whole subject, as a map.

- 1 **Nodes** — concepts the AI found in your notes 2 **Colors** — grouped by subject (math, physics, circuits...) 3 **Lines** — concepts that appear together in your pages

STEP 5 · ASK

Ask your notes anything.

- 1 Answer** — written only from your own notes, not the internet
- 2 Sources** — every answer cites the exact page and day it came from

STEP 6 · STUDY

It turns your notes into a quiz.

1 Pick a session — questions are generated from those pages **2 Explanations** — each answer is explained using your own notes

STEP 6 · STUDY

And flashcards that repeat what you forget.

- 1 Tap to flip** — question front, answer back **2 Spaced repetition** — missed cards return sooner, "knew it" cards later

HOW IT'S BUILT

Simple stack. Real product. Live today.

js-document-autocapture — camera scanning

Mistral OCR — handwriting to text

Mistral embeddings — meaning matching

Cloudflare Workers — API + pipeline

R2 — page images

D1 — notes database

Vectorize — semantic search

Queues — background processing

Open the link on your phone, capture a page, and watch it get digitized,
linked and quizzable.
